August 10, 2020

Abstract

This document provides detailed information of the numerical results used to compile the performance profiles in the article “A Class of Projected-Search Methods for Bound-Constrained Optimization” [3].

Key words. Bound-constrained optimization, projected-search methods, line search methods, projected gradient methods, quasi-Newton methods.

1. Introduction

All testing was done on problems taken from the CUTEst test collection (see Bongartz et al. [1] and Gould, Orban and Toint [4]). As of July 1, 2020, the CUTEst test set contains 154 bound-constrained problems of the form

$$\underset{x \in \mathbb{R}^n}{\text{minimize}} \quad f(x) \quad \text{subject to} \quad x \in \Omega, \quad (\text{BC})$$

where $f : \mathbb{R}^n \rightarrow \mathbb{R}$ is a twice-continuously differentiable function and $\Omega = \{x \in \mathbb{R}^n : \ell \leq x \leq u\}$ for vectors of lower and upper bounds such that $\ell \leq u$. Although many problems allow for the number of variables and constraints to be adjusted in the SIF data file, our tests used the default dimensions set in the CUTEst distribution. This gave problems ranging in size from **BQ1VAR** (one variable) to **WALL100** (149624 variables).

The methods tested were the limited-memory reduced Hessian methods **LRHB-qWolfe** and **LRHB-qArmijo**, and the limited-memory method **LBFGS-B** (Byrd et al. [2], Zhu et al. [6], and Morales and Nocedal [5]). All three solvers were terminated at the first point x_T such that

- (a) $\|P_{x_T}(-\nabla f(x_T))\|_\infty \leq 10^{-5}(1 + |f(x_T)|)$ and
- (b) $|f(x_T) - f(x_{T-1})| \leq 10^7 \epsilon_M \times \max\{|f(x_T)|, |f(x_{T-1})|, 1\}$; or
- (c) $\|P_{x_T}(-\nabla f(x_T))\|_\infty < \sqrt{\epsilon_M}$,

where ϵ_M is the machine precision. In the first iteration of the algorithms, condition (b) is ignored. A time limit of 3600 seconds and an iteration limit of 1000000 was imposed in each case.

2. The Results

Table 2 gives details of the runs for LRHB-qWolfe, LRHB-qArmijo, and LBFGS-B. The top row describes the results presented in each column. The name and dimension of the CUTEst problem appear in the first column. The second column lists the solver associated with the statistics of the row. Subsequent columns list the various statistics from the run. See Table 1 for a brief description of the entries for each column.

| | |
|--------------------|---|
| n | Number of variables. |
| x_T | First point satisfying (a)-(c). |
| $nItn$ | Number of iterations. |
| nF | Function evaluations. |
| $\mathcal{A}(x_T)$ | Number of indices in the active set at x_T . |
| Obj | The value of $f(x_T)$. |
| $Grad$ | The value of $\ P_{x_T}(-\nabla f(x_T))\ _\infty$. |
| a | Abnormal exit because of numerical difficulties. |
| i | Iteration limit exceeded. |
| t | Time limit exceeded. |
